# **How to Grow Swiss Chard**

Swiss chard or Rainbow chard (Swiss chard with color) is one of our family's favorite vegetables. It's so easy to grow, requires little maintenance and can thrive in a pot or in the ground. Its beautiful colors add charm and visual appeal to your garden which no eyes can resist. When we cook it for guests it's always a big hit! Nothing beats fresh Swiss chard from the farmers' market or enjoyed from your own garden.

#### 1. Planting:

- Purchase starter Swiss chard at a nursery and plant in the spring.
- In March and April, you may find it sold at the Farmers' markets as starter kits.
- You can also start seedlings indoors a few weeks before the last frost is anticipated.

## 2. Caring:

- Use rich soil
- In the spring and fall it typically doesn't require daily watering. In the heat, be sure to water daily.

### 3. Prevent Pests with Plant Companions:

- Marigolds can help prevent soil borne pests
- Chives can help prevent aphids (plant lice). We grow regular chives and garlic chives near our Swiss chard.
- Some gardeners recommend planting onions near Swiss chard.
- When gardening, check for caterpillars or bugs and remove them from leaves by hands.

#### 4. Harvest:

- When leaves are fully grown, cut stems at the base of the plant so that new leaves can grow back quickly.
- Weather permitting, you may be eating from the same plant from spring to late fall.

#### 5. Cook it:
